Data Model

What my app stores for each expense.

Field	Type	Description
id	text	A unique label the app creates for each expense record, so it can be edited or deleted without mixing it up with another.
description	text	What was bought, for example “Transport fare payment”. No spaces at the start or end
amount	number	The cost, always in RWF (the base currency), with no currency symbol and at most 2 decimals
category	text	The expense category the expense falls in
date	text	The day the expense happened, written `YYYY-MM-DD`
createdAt	text	Full date and time, set by the app when the record is first saved
updatedAt	text	Full date and time, set by the app. Equal to `createdAt` at first, then changed every time the record is edited

A **sample record**

id	txn_1791831600000_4821
description	Transport fare payment
amount	500
category	Transport
date	2026-10-12
createdAt	2026-10-12T19:00:00.000Z
updatedAt	2026-10-12T19:00:00.000Z

Settings

Setting	**Value**

Base currency	Every `amount` is stored in RWF
Other currencies	USD and UGX. They are used only to show converted values.
Monthly spending cap	Typed in manually in Settings
Categories	200,000 RWF per calendar month. The dashboard shows what is remaining or the overage.
Categories	Food, Books, Transport, Entertainment, Fees, Other. This is editable

ID Rule

Each new record gets an id made from the prefix `txn_`, the current timestamp, and a few random digits, so that no two records ever share an id, even if one is deleted or two are created at the same moment.

Accessibility Plan

Area	Plan
Landmarks	Wrap the page in `header`, `nav`, `main`, and `footer`, with one `section` for each of the five screens.
Headings	Use one `h1` for the app name, an `h2` for each section, and `h3` for smaller parts. Do not skip levels.
Skip link	Add a “Skip to main content” link as the first thing on the page. Show it only when it gets keyboard focus.
Labels	Give every input a visible `<label>` linked to it. Do not rely on placeholder text.
Keyboard	Make sure everything works with the keyboard only, in the same order it appears on screen.
Focus	Show a clear outline on whatever is focused. Never remove it without a replacement.
Live messages	Announce “Saved” and “Deleted” politely. Announce the cap politely when under 200,000 RWF and assertively when over.
Errors	Show each error as text under its field, not by colour alone, and link the error to the field.

Delete confirmation	Ask for confirmation before deleting a record.
Search highlight	Use `<mark>` for matches and announce how many records matched.
Animation	Keep transitions short, and turn them off for users who choose “reduce motion”.

Keyboard Map

Key	Action
Tab / Shift + Tab	Move forward / back
Enter	Open a link, press a button, submit the form
Space	Press a button, tick a checkbox
Arrow keys	Change a dropdown choice
Escape	Cancel an edit or close the delete confirmation
